NACE MR0175/ISO 15156 Compliance - Materials of construction shall be in compliance with the pre-qualified material requirements specified by NACE MR0175/ISO 15156. According to NACE MR0175/ISO 15156, it is the manufacturer's responsibility for meeting metallurgical requirements and the customer/user responsibility to ensure that a material will be satisfactory in the intended environment. When given the application requirements (environment) by the customer/user, Cameron can make technical recommendations in accordance with NACE MR0175/ISO 15156 but in no way certifies or warrants the product or materials for the application.

WKM DYNASEAL 210 FEATURES AND BENEFITS

This rugged but economical ductile iron ball valve is ideal for threaded end oilfield applications where carbon steel body material is not a requirement.

The WKM DynaSeal 210 Ball Valve is a two-piece design with a ductile iron body and tailpiece. This valve is economical and it includes many of the premium design features found in the WKM DynaSeal 310 Carbon Steel Ball Valve.

It is available in 1 in. (25 mm) to 4 in. x 3 in. (100 mm x 80 mm) sizes. Working pressures offered are 750, 1,000, 1,500 and 2,000 psi. (See size/pressure table on page 4).

This valve is primarily used in the oilfield market for the following applications.

- Production wing valves on low pressure gas wells
- Production flow lines
- Production gathering systems for water, oil and gas
- Gas blow down service
- Tank batteries for storage or production
- Frac water tanks

WKM DYNASEAL 210 FEATURES AND BENEFITS

LOCKING CAPABILITY IS STANDARD

- The valve can be locked in the open or closed position

POSITIVELY RETAINED STEM

- The stem is positively retained. It is designed to prevent stem blowout while the valve is in service

COLOR CODED WORKING PRESSURES

The lock plates are color coded so pressure ratings are quickly identified

- 750/1,000 psi green
- 1,500 psi blue
- 2,000 psi red

FIRE TESTED DESIGN

The WKM DynaSeal 210 Ball Valves are qualified under API Standard 607. The deep pocketed seat, locked in stem and body/tailpiece designs give this valve excellent fire tested characteristics.

SUPERIOR STEM JOURNAL DESIGN PREVENTS STEM SEIZURE

The stem is designed with two internal O-ring grooves located on either side of a shallow grease groove.

The top O-ring is a weather seal while the bottom one seals the stem bore against the line media. The stem gasket provides a backup seal.

The shallow groove between the O-rings provides three benefits:

- prevents stem seizure
- reduces torque
- provides a space for lubricating grease applied at the factory during assembly

UNIDIRECTIONAL BALL (OPTION)

The WKM DynaSeal 210 unidirectional valve option provides relief to valves that might have water trapped in the body cavity and then be exposed to a temporary freeze. Since this option relies on a relief hole in the ball to relieve the excess pressure the valve is stamped with a directional flow arrow to be sure the side of the ball with the hole is installed upstream.

TFE BODY SEAL

A TFE body seal is positioned between the line bore and tailpiece threads isolating the threads from the line media.

DEEP RECESSED SEATS

The seat is recessed into a deep machined pocket, which serves to surround and protect the seat on all sides. This design eliminates cold flow into the valve conduit where it can be damaged by the action of the ball or the flow medium. The result is extremely long service life.

SEAL PIN DEVICE PROVIDED AS STANDARD ON 750 AND 1000 psi, 2 in., 3 in. AND 4 in.

(50 mm, 80 mm AND 100 mm) REDUCED PORT VALVES.

A secondary seal pin device for applying tamper detection is provided on these valves. These valves are a popular choice for production tank batteries where tamper detection is often required.

4 in. x 3 in. (100 mm x 80 mm) REDUCED PORT

UNIDIRECTIONAL BALL

STANDARDS AND SPECIFICATIONS

WKM DynaSeal 210 Ball Valves conform to the following design and testing standards:

STANDARD MATERIALS

- API line pipe threads
- Body: Ductile Iron
- Ball and Stem: Carbon Steel or Stainless Steel
- Seat and Seals: Acetal Plastic/Buna-N

OPTIONAL MATERIALS

- Ball and Stem: Stainless Steel
- Seat and Seals: TFE/FKM

COMPLIANCES

- ASME B16.5
- MSS-SP-6, 25, 55, 72 and 61
- NACE MR0175/ISO 15156
- API 607 Fire Test Specification

TRIM GUIDELINES FOR ALL WKM DYNASEAL 310 VALVES

This chart is an abbreviated guide to the chemical resistance and pressure/temperature limitations of the seal materials used in the WKM DynaSeal 310 Floating Ball Valve.

Consult your DynaSeal distributor or the WKM factory regarding questions about trim selections.

SEAL CODE	SEAT MATERIAL	TAILPIECE GASKET	SERVICE APPLICATION
01	TFE	TFE	Seat and Tailpiece gaskets are of Virgin TFE. Use where lading contamination from glass or other fillers is not desirable, such as in food service. Recommended for low temperature service to -50°F (-46°C). Also recommended for vacuum service.
42	Filled TFE	TFE	Seat material is TFE filled with inert materials for use at elevated temperatures and pressures. Same chemical resistance as Virgin TFE except slightly affected by hot concentrated alkaline solutions. Some chlorinated compounds can cause swelling. Also recommended for low temperature service -50°F (-46°C). Good for vacuum service.
43	Homopolymer Acetal Plastic	TFE	For general use at high pressures to temperature of 220°F (104°C).
48	Homopolymer Acetal Plastic	Filled TFE	For general use at high pressures to temperature of 220°F (104°C). Used on socket weld end valves 3 in. (80 mm) bore size and smaller.
07	*FKM/SS	TFE	High and low pressure block-and-bleed. General use for low pressure and abrasion resistance. Not suitable for steam. Good for vacuum service. Available in bore sizes to 3 in. (80 mm).
18	HPT-2	Filled TFE	HPT-2 is a special TFE formulation for use at temperatures above trim 42 capability. Best suited for constant temperature or constant pressure applications. Proven service in steam, hot oil, heat transfer fluids, hot resins, boiler feed water. Same chemical resistance as TFE. Slightly affected by hot, concentrated alkaline solutions. Some fluorinated compounds cause swelling.
23	Celcon	TFE	For use in high pressure applications. Temperature limited to 225°F (107°C) (1/4 in. to 3/4 in. (8 mm to 20 mm) bores only).
28	Filled TFE	Filled TFE	Same as 42 except tailpiece gasket is filled TFE. Used on weld end valves 4 in. (100 mm) and larger.
92H	Chrome Carbide/316 Graphite		Metal-to-Metal ball and seat made of Chrome Carbide over 316 SS

Note 1: Trim 07 and 18 should be tested for each application by actual use.

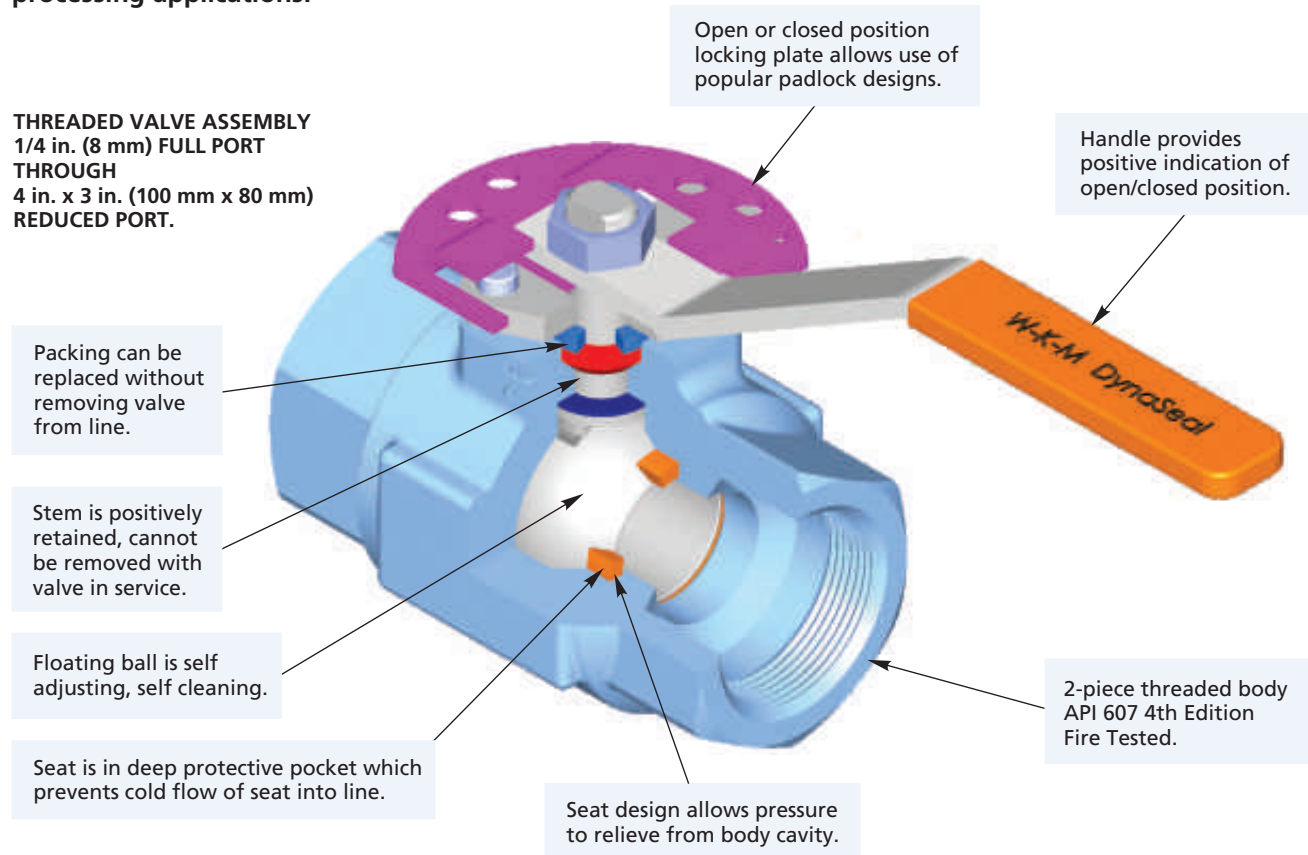

Note 2: All seal codes with the exception of 07, have been Fire Tested (and qualified) to API 607 4th Edition requirements.

* Trim sizes smaller than 1 1/2 in. (40 mm) in trim 07 are 100% elastomeric. Sizes 1 1/2 in. (40 mm) and larger are elastomeric with a metal insert.

WKM DYNASEAL 310 FEATURES AND BENEFITS

A premium quality floating ball valve that has proven itself in a wide variety of oilfield, chemical, petrochemical and hydrocarbon processing applications.

THREADED VALVE ASSEMBLY
 1/4 in. (8 mm) FULL PORT
 THROUGH
 4 in. x 3 in. (100 mm x 80 mm)

 REDUCED PORT.

WKM DYNASEAL 310

WKM DynaSeal 310 Floating Ball Valves satisfy a wide range of applications. Available in a variety of standard and optional materials, in sizes from 1/4 in. (8 mm) to 4 in. x 3 in. (100 mm x 80 mm) and working pressures to 5000 psi. Engineered for heavy duty, maintenance free performance, the DynaSeal 310 Ball Valve is preferred for use in critical applications.

SOUR OIL AND GAS SERVICE

WKM DynaSeal Ball Valves are suited to applications within gathering lines, manifolds and field processing units in sour oil and gas fields. They can be trimmed to conform with NACE MR0175/ISO 15156.

FEATURES AND BENEFITS

DEEP RECESSED SEATS

The WKM DynaSeal 310 seat is protected in a machined recess or deep pocket that surrounds and protects the seat. This design eliminates cold flow into the valve conduit and avoids potential seat damage from ball movement or flow media.

TRIM 42 SEATS

Seats are manufactured of filled TFE and rated to 1500 psi MOP. With working temperatures to 500°F (260°C) and low torque operation these seats satisfy even the most difficult of processing requirements.

TRIM 43 SEATS

Seats are manufactured of Acetal Plastic and rated to 3000 psi MOP and working temperatures to 220°F (104°C). These seats are designed to handle the most demanding applications. These seats are designed to flex under pressure and provide a consistent range of low torque operations. They provide a full face seal against the ball and multiple seals against the top and back of the pocket to provide a positive seal.

ADJUSTABLE, REPLACEABLE PACKING

The in-line valve stem packing consists of PTFE impregnated graphite with an impervious metal barrier and a secondary tapered metal backup. The packing is field adjustable and never requires lubrication. The packing and the stainless steel cap can be replaced without removing the valve from the line.

POSITIVELY RETAINED STEM

The stem is positively retained with a shoulder. It cannot be removed with the valve in service. There are no O-rings used in this design.

Socket Weld End
310 Ball Valve

TRIM 42 SEAT

TRIM 43 SEAT

ADJUSTABLE PACKING

FLOATING BALL DESIGN DELIVERS TIGHT SEAL

The ground and polished ball is free to float and mates perfectly with the conical seats for a positive, leakproof seal. Self cleaning and self adjusting, the ball is also pressure activated - the higher the line pressure, the tighter the seal.

FIRE TESTED FOR SAFETY

All WKM DynaSeal 310 Ball Valves are qualified under API standard 607 4th Edition. The pocketed seat and locked in stem design contributes to its excellent Fire Tested characteristics. Should the soft seats be destroyed by fire, the ball floats downstream, providing a tight metal-to-metal seal against the lip of the seat pocket. If the tailpiece seals are destroyed, the metal-to-metal tailpiece to body connection retards external leakage.

INDICATOR HANDLE

The design of the handle permits installation on the stem in the correct position only, in alignment with the ball port. When the handle is aligned with the pipe, the valve is open. When the handle is perpendicular to the pipe, the valve is closed.

LOCKING DEVICES

Locking devices are standard on all 4 in. x 3 in. (100 mm x 80 mm) and smaller manually operated valves and permit locking in either the open or closed positions.

WKM DYNASEAL 310 FEATURES AND BENEFITS

Handle can be installed in correct position only in alignment with the ball port.
 Handle aligned with piping shows valve is open.
 Handle perpendicular shows valve is closed.
 4 in. (100 mm) and 6 in. (150 mm) bore only.

GEAR OPERATOR REQUIRED FOR 8 in. (200 mm) FULL PORT AND LARGER.

310C
 ASME CLASSES 150, 300 AND 300 BW
 4 in. (100 mm) FULL PORT THROUGH
 14 in. x 12 in. (350 mm x 300 mm)
 REDUCED PORT
 NACE MR0175/ISO 15156.

Stop plate provides ball alignment and visual indication of open or closed position.
 4 in. (100 mm) and 6 in. (150 mm) bore only.

Packing can be adjusted or replaced without removing valve from line.

Anti-static grounding spring standard.

Seat design allows pressure to relieve from body cavity.

Deep seat pockets protects seats from the flow to extend service life.

Body Drain Fitting.
 (Not shown)

310F2
 ASME CLASS 600
 4 in. (100 mm) FULL PORT THROUGH
 8 in. x 6 in. (200 mm x 150 mm)
 REDUCED PORT
 NACE MR0175/ISO 15156.
 GEAR OPERATORS REQUIRED FOR ALL SIZES.

O-Ring stem seal.

Trim 43 Acetal plastic deep pocketed seats.

Body Drain Fitting.
 (Not shown)

WKM DYNASEAL 310

WKM DynaSeal 310 Ball Valves satisfy a wide range of applications. Available in a variety of standard and optional materials, they may be specified in sizes from 4 in. (100 mm) to 14 in. (350 mm) and ASME Class 150 and 300. ASME Class 600 is available in sizes 4 in. (100 mm) through 8 in. x 6 in. (200 mm x 150 mm). Engineered for heavy duty, maintenance free performance, the WKM DynaSeal 310 Ball Valve is commonly selected for a variety of applications in virtually any industry.

CHEMICAL & PETROCHEMICAL PLANTS

The list of chemical and petrochemical applications for WKM DynaSeal 310 Ball Valves is limitless. They are serving in many plastic plants handling such slurries as 40% vinyl chloride, in high pressure catalyst lines and in processes handling dry lading such as polyethylene and polystyrene powders.

There are hundreds of applications in such plants where WKM DynaSeal 310 Ball Valves are providing efficient service.

REFINING

WKM DynaSeal 310 Ball Valve is the workhorse of the refining industry. The many metal seats, seals and available trims offer the versatility needed to handle the wide variety of products used in the refining process.

HIGH TEMPERATURE SERVICE

Special high temperature trims are available for WKM DynaSeal 310 Ball Valves which provide for service to 600°F (316°C). This trim is excellent for steam service, hot oil, heat transfer fluids, boiler feed water and similar applications.

LOW TEMPERATURE SERVICE

Standard trims accommodate temperatures to -20°F (-29°C). For temperatures to -50°F (-46°C); please consult factory.

MAINTENANCE FREE PERFORMANCE

Under most conditions, the WKM DynaSeal 310 Ball Valve will provide years of trouble free service with no maintenance required. In some severe applications, such as handling extremely abrasive slurries at high temperature, it may be necessary to replace the seats occasionally. Seat and seal kits are available and replacement can be done easily with ordinary tools.

SOUR OIL AND GAS SERVICE

WKM DynaSeal 310 Ball Valves have served for years in gathering lines, manifolds and field processing units in sour oil and gas fields. They can be trimmed to conform with NACE MR0175/ISO 15156.

TEFLON BODY SEAL

A Teflon body seal is used between the valve body and tailpiece.

DEEP RECESSED SEATS

The seat is recessed into a deep machined pocket, which serves to surround and protect the seat on all sides. This design eliminates cold flow into the valve conduit where it can be damaged by the action of the ball or the flow medium. The result is extremely long service life.

ADJUSTABLE, REPLACEABLE PACKING

The in-line valve stem packing through ASME Class 300 consists of PTFE impregnated graphite with an impervious metal barrier. The packing is field adjustable and never requires lubrication. The packing and the stainless steel cap can be replaced without removing the valve from line.

FUGITIVE EMISSIONS

WKM DynaSeal 310 Ball Valves through ASME Class 300 can be supplied and certified to meet the requirements of fugitive emissions as regulated by The 1990 Amendment to The Clean Air Act to 100 ppm.

POSITIVELY RETAINED STEM

The stem is positively retained and cannot be removed with the valve in service.

INDICATOR HANDLE

The design of the handle ASME Class 300 permits installation on the stem in the correct position only, in alignment with the ball port. When the handle is aligned with the pipe, the valve is open. When the handle is perpendicular to the pipe, the valve is closed.

FLOATING BALL DESIGN DELIVERS TIGHT SEAL

The ground and polished ball is free to float and mates perfectly with the conical seats for a positive, leakproof seal. Self cleaning and self adjusting, the ball is also pressure activated. The higher the line pressure, the tighter the seal.

FEATURES AND BENEFITS

ACTUATION FRIENDLY

A variety of actuator types can be easily installed, including pneumatic, hydraulic, diaphragm, vane, electro-mechanical and electro-hydraulic.

FIRE TESTED FOR SAFETY

All WKM DynaSeal 310 Ball Valves are qualified under API Standard 607 4th Edition. The pocketed seat and locked in stem design contributes to its excellent Fire Tested characteristics. Should the soft seats be destroyed by fire, the ball floats downstream, providing a tight metal-to-metal seal against the lip of the seat pocket. If the tailpiece seals are destroyed, the metal-to-metal tailpiece to body connection retards external leakage.

* Centerline-to-face dimension is half of dimension A, except:
 4 in. (100 mm) ASME Class 150 Full Port - stem is offset 1/2 in. (12.7 mm) towards body end and 6 in. (150 mm).
 ASME Class 150 Full Port Long Pattern - stem is offset 2 1/2 in. (63.5 mm) towards body end.

PRESSURE/TEMPERATURE FOR ALL WKM DYNASEAL 310 BALL VALVES

WKM DynaSeal 310 Ball Valves are rated for high performance and long life.

The ratings shown here are based on tests which indicate good seat performance and acceptable wear.

This rating is determined by the lower of the valve's pressure or seat rating.

The seat rating is the maximum differential pressure to which the valve should be subjected on a continuous basis.

Seal codes 01, 42 & 07 are suitable for vacuum service to 20 microns, absolute (minimum temperature 0°F (-18°C)).

PRESSURE/TEMPERATURE LIMITS FOR WKM DYNASEAL 310 BALL VALVES BODY ASSEMBLIES

FLANGED VALVES

Data is maximum working pressure ratings for the valve body assembly at various temperatures. Practical pressure limitations according to actual service conditions are determined by the seal and tailpiece gasket materials.

12	(300)	32000	39000	46500

Note: The torque values listed for 285 psi and greater are based on valves controlling the flow of clean lubricating liquid at ambient temperature.

For valves at pressure less than 285 psi use the value for 285 psi.

Interpolation may be used for any pressure above 285 psi but less than maximum pressure listed.

Running torque values will average two-thirds of these values.

For running torque values less than breakaway torque values at 285 psi use breakaway torque values.

Reseating torque is equal to breakaway torque.

For operating temperatures between -20°F to -50°F (-29°C to -46°C) multiply these values by 1.20.

These torque values do not contain service or safety factors.

Actuator selection should be made based on experience and appropriate service and safety factors.

WKM DYNASEAL MATERIAL SELECTION GUIDE

A selection of body, stem and seat/seal materials for WKM DynaSeal Valves are available. The following list is intended as a guide in the selection of materials for corrosive service.

No material can be expected to resist the corrosive action of all the many ladings found in modern industry. Experience has shown, however, that certain materials can perform satisfactorily within certain limits.

The physical properties of a material are affected differently by each corrosive medium. Therefore, it sometimes becomes necessary to sacrifice value in another property. As a result, the user must decide which property is of prime importance for his application.

Internal moving parts, in contact with the lading, should always carry an "A" rating. Body materials with exposure to corrosive ladings can sometimes carry "B" rating because metal loss due to corrosive is not as critical.

The following information is designed for use by technically qualified individuals at there own discretion and risk.

We strongly recommend that tests be run under actual operating conditions to obtain a material's performance ability in any one corrosive medium.

Rating interpretation:

- "A" - excellent;
- "B" - good (slightly attacked);
- "C" - fair (moderately attacked, probably unsuitable);
- "D" - not recommended.
